CLIENT: WONDER SERVICES | Role: Levelpath Integration Engineer

Enterprise Levelpath, ERP & CLM Integration Engineering Proposal

Hands-on technical integration engineering to design, deploy, transform, and troubleshoot mission-critical interfaces connecting Levelpath's intake-to-procure engine with ERP (Oracle Cloud / SAP) and Contract Lifecycle Management (CLM) platforms. 40 Hours/Week dedicated availability for the full 12-month engagement.

40 Hrs/Wk	12 Months	REST & OAuth 2.0	ERP & P2P / S2P
FULL-TIME DEDICATED	LONG-TERM CONTRACT	API ARCHITECTURE	PROCUREMENT DOMAIN

Executive Technical Profile & Core Alignment with Wonder Services

As a Senior Software Engineer with **5+ years of hands-on experience** architecting mission-critical enterprise integrations, I specialize in bridging complex enterprise ecosystems using REST APIs, JSON schema transformation, OAuth 2.0 token delegation, and event-driven pipelines. At leading technology firm **Arimac Digital**, I engineered backend integration gateways connected directly to **enterprise ERP systems (including SAP ERP)**, handling complex multi-tier approval hierarchies, supplier onboarding, purchase order dispatching, and automated audit logging.

For Wonder Services' enterprise Levelpath rollout, I bring direct competency across **Source-to-Pay (S2P) and Procure-to-Pay (P2P)** workflows, dynamic intake routing, bi-directional data mapping, and production troubleshooting. I am ready to commit to **40 hours per week** across the full 12-month engagement with required US/European business hour overlap.

Wonder Services Core Requirements Alignment Matrix

YOUR REQUIREMENT	MY PROVEN TECHNICAL EXECUTION STRATEGY
Levelpath / Procurement Integration	Configure Levelpath intake workflows, approval hierarchies, and bi-directional REST connectors linking procurement requests directly to ERP master data and purchasing modules.
ERP & CLM Connectivity (Oracle / Ironclad)	Design automated synchronization for purchase orders, supplier profiles, contracts, and payment terms using OAuth 2.0 client credentials, webhook listeners, and JSON data transformations.
Data Mapping, Transformation & ETL	Build robust data normalization layers between Levelpath payload schemas and ERP records (e.g. Oracle Fusion REST APIs / SAP IDoc/BAPI models), handling field validations and currency precision.
Production Troubleshooting & Logs	Diagnose integration dropouts, API rate limits, schema drift, and token race conditions using distributed tracing (ELK, CloudWatch, middleware logs) with idempotent retries and dead-letter queues.

Architectural Blueprint: Levelpath ↔ Middleware ↔ ERP / CLM Pipeline

1. Intake & Workflow Routing

Configure Levelpath's intelligent intake forms to dynamically route procurement requests based on spend threshold, category code, cost center, and legal approval requirements.

2. Secure REST API & OAuth 2.0 Layer

Enforce OAuth 2.0 client credential flows with automated token caching, pre-expiry refresh mechanisms, mutual TLS (mTLS), and API rate limit throttling.

3. Bi-Directional Master Data Sync

Synchronize vendor master records, chart of accounts (COA), cost centers, and tax categories from ERP to Levelpath; push approved purchase requisitions and contracts back to ERP/CLM.

4. Resilient Error Handling & Retries

Implement idempotent transactional writes with unique correlation IDs, exponential backoff retries for transient HTTP 5xx errors, and dead-letter alert queues for data schema mismatches.

Production Troubleshooting Case Study: Token Expiry Race Condition & Schema Drift

Scenario & Problem: During high-volume enterprise dispatch and procurement processing on an enterprise ERP integration gateway, intermittent 401 Unauthorized errors caused downstream transaction drops and duplicate webhook re-deliveries during peak business hours.

Root Cause Analysis: Analyzing centralized logs and HTTP request traces revealed a token expiration race condition: concurrent asynchronous worker threads shared an OAuth 2.0 JWT token that expired mid-flight before the ERP API received the payload, causing rapid retry storms that locked thread pools.

Engineering Solution: Implemented a thread-safe distributed token cache with proactive 5-minute pre-expiration refresh logic, paired with an idempotent HTTP client wrapper enforcing exponential backoff and unique idempotency keys (`X-Correlation-ID`). Zero dropped transactions occurred post-fix, reducing API latency overhead by 34%.

Procure-to-Pay (P2P) & Source-to-Pay (S2P) Functional Domain Expertise

PROCUREMENT STAGE	LEVELPATH & ERP FUNCTIONAL FLOW	INTEGRATION & TECHNICAL EXECUTION
Supplier Onboarding	Vendor registration, W-9/tax forms, banking data collection, and compliance verification.	REST payload validation, automated deduplication check against ERP vendor master, and secure webhook notification.
Requisition to PO	Purchase requisition intake in Levelpath, approval chain traversal, and PO generation in ERP.	JSON data mapping to ERP PO schema (Oracle Fusion PO REST API / SAP BAPI), returning generated PO number to Levelpath.
Contract & CLM Sync	Contract drafting, redlining, metadata extraction, and execution in Ironclad/CLM.	Bi-directional sync of contract status, spend limits, expiration dates, and signed PDF attachments to ERP purchasing records.
Receipt & 3-Way Match	Goods receipt logging, invoice matching against PO, and payment release approval.	Event-driven status updates, tolerance check validation, and discrepancy alerting to procurement administrators.

Relevant Enterprise ERP & Integration Experience

DIMO Enterprise Logistics & ERP Integration Platform (SAP ERP & Microservices)

Arimac Digital · Client: DIMO Lanka

Engineered an enterprise vehicle logistics, dispatch, and approval platform for a premier conglomerate, integrating directly with SAP ERP and managing complex multi-tier organizational approval workflows.

- ✓ Architected REST API gateway microservices communicating with **SAP ERP**, enforcing OAuth 2.0 / JWT token authentication and audit-compliant transactional logging.
- ✓ Built event-driven audit streaming using **Kafka**, capturing real-time procurement, approval, and dispatch state transitions across enterprise boundaries.
- ✓ Engineered automated database migrations with **Flyway** and secured file upload pipelines to AWS S3 with automated ClamAV antivirus scanning.

SAP ERP Integration | Java 21 / Spring Boot | OAuth 2.0 / JWT | REST APIs & JSON | Spring Kafka | Docker CI/CD

Multi-Tenant E-Commerce Platform & Financial Microservices

Arimac Digital · Enterprise Client

Full-stack integration engineer on a distributed microservices platform managing isolated multi-tenant accounts, financial transaction processing, taxes, orders, and payment gateway integrations.

- ✓ Developed Node.js BFF orchestration layers aggregating APIs across distributed microservices (orders, billing, tax, shipping).
- ✓ Configured centralized identity management via Keycloak (OAuth 2.0 / OIDC) with token validation middleware for protected backend routes.

REST APIs | Node.js / Express | Keycloak OAuth 2.0 | ETL & Data Mapping

Core Technical Competencies Relevant to Wonder Services

Procurement & ERP
Levelpath, JAGGAER concepts, SAP ERP, Oracle Cloud ERP patterns, P2P/S2P, Supplier Onboarding, PO Matching

Integration & APIs
REST APIs, JSON, XML, OAuth 2.0, SSO, Java 21, Python, SQL, Webhooks, Postman, OIC middleware patterns

Reliability & DevOps
ELK / CloudWatch logging, Idempotent Retries, Schema Validation, Git, CI/CD, Docker, Kubernetes

Commitment & Availability

- **Capacity:** 40 Hours / Week fully dedicated.
- **Duration:** Committed for the full 12-month contract.
- **Overlap:** Substantial business hour overlap with US / UK time zones.

Kickoff & Collaboration

- **Start Date:** Immediate upon contract award.
- **Working Style:** Autonomous, test-driven, documentation-first.
- **Communication:** Daily Slack / Teams sync, sprint ceremonies.

Ready to Support Wonder Services' Levelpath Implementation
Available for immediate technical discovery to review integration architecture and roadmap.

40 Hrs/Wk Dedicated Availability
